

# Java Programming Language SE – 6

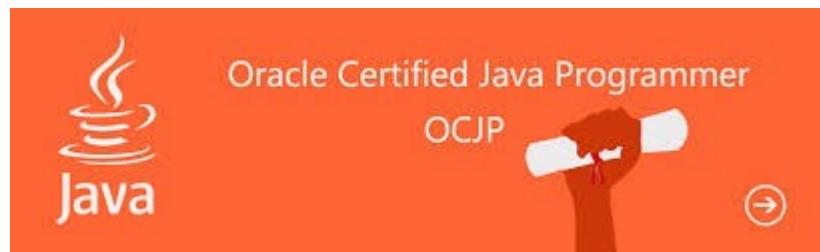

## Module 10: I/O Fundamentals

**ORACLE®**  
**Certified Professional**  
Java SE 6 Programmer

# Objectives

- Write a program that uses command-line arguments and system properties
- Examine the Properties class
- Construct node and processing streams, and use them appropriately
- Serialize and deserialize objects
- Distinguish readers and writers from streams, and select appropriately between them

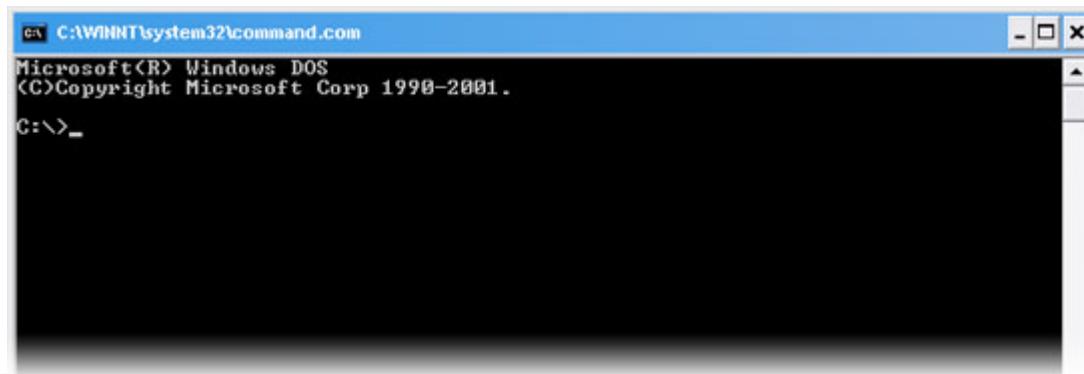

# Command-Line Arguments

- Any Java technology application can use command-line arguments.
- These string arguments are placed on the command line to launch the Java interpreter after the class name:

*java TestArgs arg1 arg2 "another arg"*

- Each command-line argument is placed in the args array that is passed to the static main method:

*public static void main(String[] args)*

# Command-Line Arguments

```
public class TestArgs {  
    public static void main(String[] args) {  
        for ( int i = 0; i < args.length; i++ ) {  
            System.out.println("args[" + i + "] is '" + args[i] + "'");  
        }  
    }  
}
```

- Example execution:

```
java TestArgs arg0 arg1 "another arg"
```

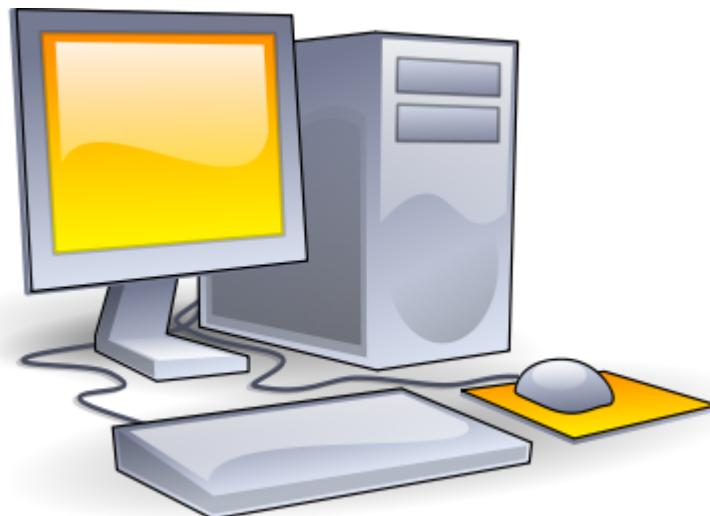

```
args[0] is 'arg0'
```

```
args[1] is 'arg1'
```

```
args[2] is 'another arg'
```

# System Properties

- System properties are a feature that replaces the concept of environment variables (which are platform-specific).
- The `System.getProperties` method returns a `Properties` object.
- The `getProperty` method returns a `String` representing the value of the named property.
- Use the `-D` option on the command line to include a new property.

# The Properties Class

- The Properties class implements a mapping of names to values (a String-to-String map).
- The propertyNames method returns an Enumeration of all property names.
- The getProperty method returns a String representing the value of the named property.
- You can also read and write a properties collection into a file using load and store.

# The Properties Class

```
import java.util.Properties;  
import java.util.Enumeration;  
  
public class TestProperties {  
    public static void main(String[] args) {  
        Properties props = System.getProperties();  
        props.list(System.out);  
    }  
}
```

# The Properties Class

The following is an example test run of this program:

```
java -DmyProp=theValue TestProperties
```

- The following is the (partial) output:

```
java.runtime.name=Java(TM) SE Runtime Environment  
sun.boot.library.path=C:\jse\jdk1.6.0\jre\bin  
java.vm.version=1.6.0-b105  
java.vm.vendor=Sun Microsystems Inc.  
java.vm.name=Java HotSpot(TM) Client VM  
file.encoding.pkg=sun.io  
user.country=US  
myProp=theValue
```

# Stream

# I/O Stream Fundamentals

- A stream is a flow of data from a source or to a sink.
- A source stream initiates the flow of data, also called an input stream.
- A sink stream terminates the flow of data, also called an output stream.
- Sources and sinks are both node streams.
- Types of node streams are files, memory, and pipes between threads or processes.

# Fundamental Stream Classes

---

Stream	Byte Streams	Character Streams
Source streams	InputStream	Reader
Sink streams	OutputStream	Writer

---

# Data Within Streams

- Java technology supports two types of streams: character and byte.
- Input and output of character data is handled by readers and writers.
- Input and output of byte data is handled by input streams and output streams:
- Normally, the term stream refers to a byte stream.
- The terms reader and writer refer to character streams.

# The InputStream Methods

- The three basic read methods are:
  - int read()
  - int read(byte[] buffer)
  - int read(byte[] buffer, int offset, int length)
- Other methods include:
  - void close()
  - int available()
  - long skip(long n)
  - boolean markSupported()
  - void mark(int readlimit)
  - void reset()

# The OutputStream Methods

- The three basic write methods are:
  - `void write(int c)`
  - `void write(byte[] buffer)`
  - `void write(byte[] buffer, int offset, int length)`
- Other methods include:
  - `void close()`
  - `void flush()`

# The Reader Methods

- The three basic read methods are:
  - int read()
  - int read(char[] cbuf)
  - int read(char[] cbuf, int offset, int length)
- Other methods include:
  - void close()
  - boolean ready()
  - long skip(long n)
  - boolean markSupported()
  - void mark(int readAheadLimit)
  - void reset()

# The Writer Methods

- The basic write methods are:
  - `voidwrite(int c)`
  - `Void write(char[] cbuf)`
  - `Void write(char[]cbuf, int offset, int length)`
  - `Void write(String string)`
  - `Void write(String string, int offset, int length)`
- Other methods include:
  - `void close()`
  - `void flush()`

# Node Streams

Type	Character Streams	Byte Streams
File	FileReader	FileInputStream
	FileWriter	OutputStream
Memory: array	CharArrayReader	ByteArrayInputStream
	CharArrayWriter	ByteArrayOutputStream
Memory: string	StringReader	N/A
	StringWriter	
Pipe	PipedReader	PipedInputStream
	PipedWriter	PipedOutputStream

# A Simple Example

This program performs a copy file operation using a manual

buffer:

```
java TestNodeStreams file1 file2  
public static void main(String[] args) {  
    try {  
        FileReader input = new FileReader(args[0]);  
        try {  
            FileWriter output = new FileWriter(args[1]);  
            try {  
                char[] buffer = new char[128];  
                int charsRead;  
                charsRead = input.read(buffer);  
                while ( charsRead != -1 ) {  
                    // next slide
```

# A Simple Examples

```
output.write(buffer, 0, charsRead);
charsRead = input.read(buffer);
}
} finally {
output.close();}
} finally {
input.close();}
} catch (IOException e) {
e.printStackTrace();
}}
```

# Buffered Streams

This program performs a copy file operation using a built-in buffer: java TestBufferedStreams file1 file2

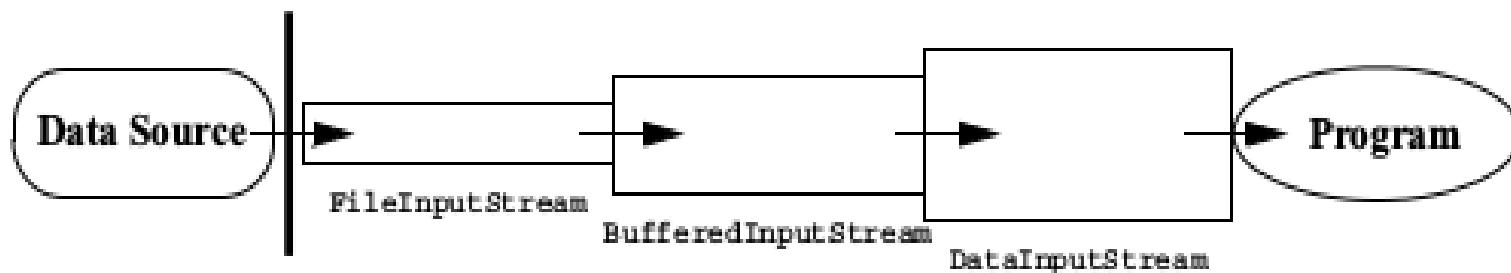

```
public static void main(String[] args) {  
    try {  
        FileReader input = new FileReader(args[0]);  
        BufferedReader buflnput = new BufferedReader(input);  
        try {  
            FileWriter output = new FileWriter(args[1]);  
            BufferedWriter bufOutput= new BufferedWriter(output);  
            try {  
                String line;  
                line = buflnput.readLine();  
                while ( line != null ) {
```

# Buffered Streams

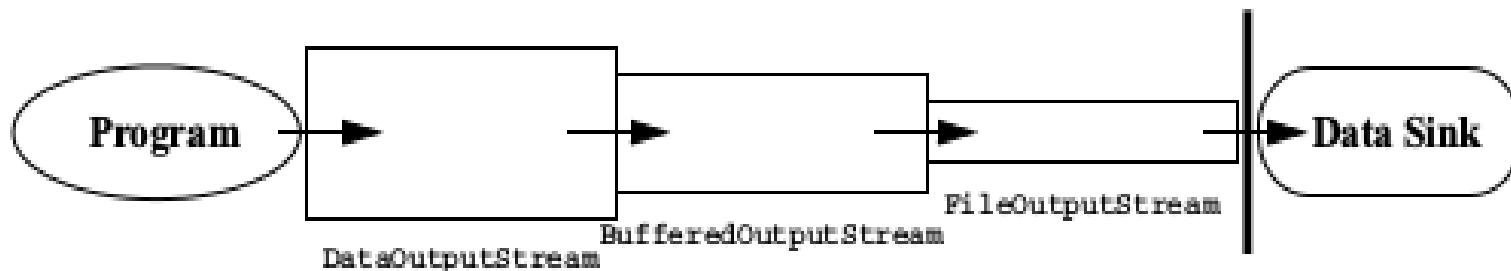

```
bufOutput.write(line, 0, line.length());
bufOutput.newLine();
line = buflnput.readLine();
}
} finally {
bufOutput.close();
}
} finally {
buflnput.close();
}
} catch (IOException e) {
e.printStackTrace();
}}
```

# I/O Stream Chaining

## Input Stream Chain

## Output Stream Chain

# Processing Streams

Type	Character Streams	Byte Streams
Buffering	BufferedReader	BufferedInputStream
	BufferedWriter	BufferedOutputStream
Filtering	FilterReader	FilterInputStream
	FilterWriter	FilterOutputStream
Converting between bytes and character	InputStreamReader	
	OutputStreamWriter	
Performing object serialization		ObjectInputStream
		ObjectOutputStream

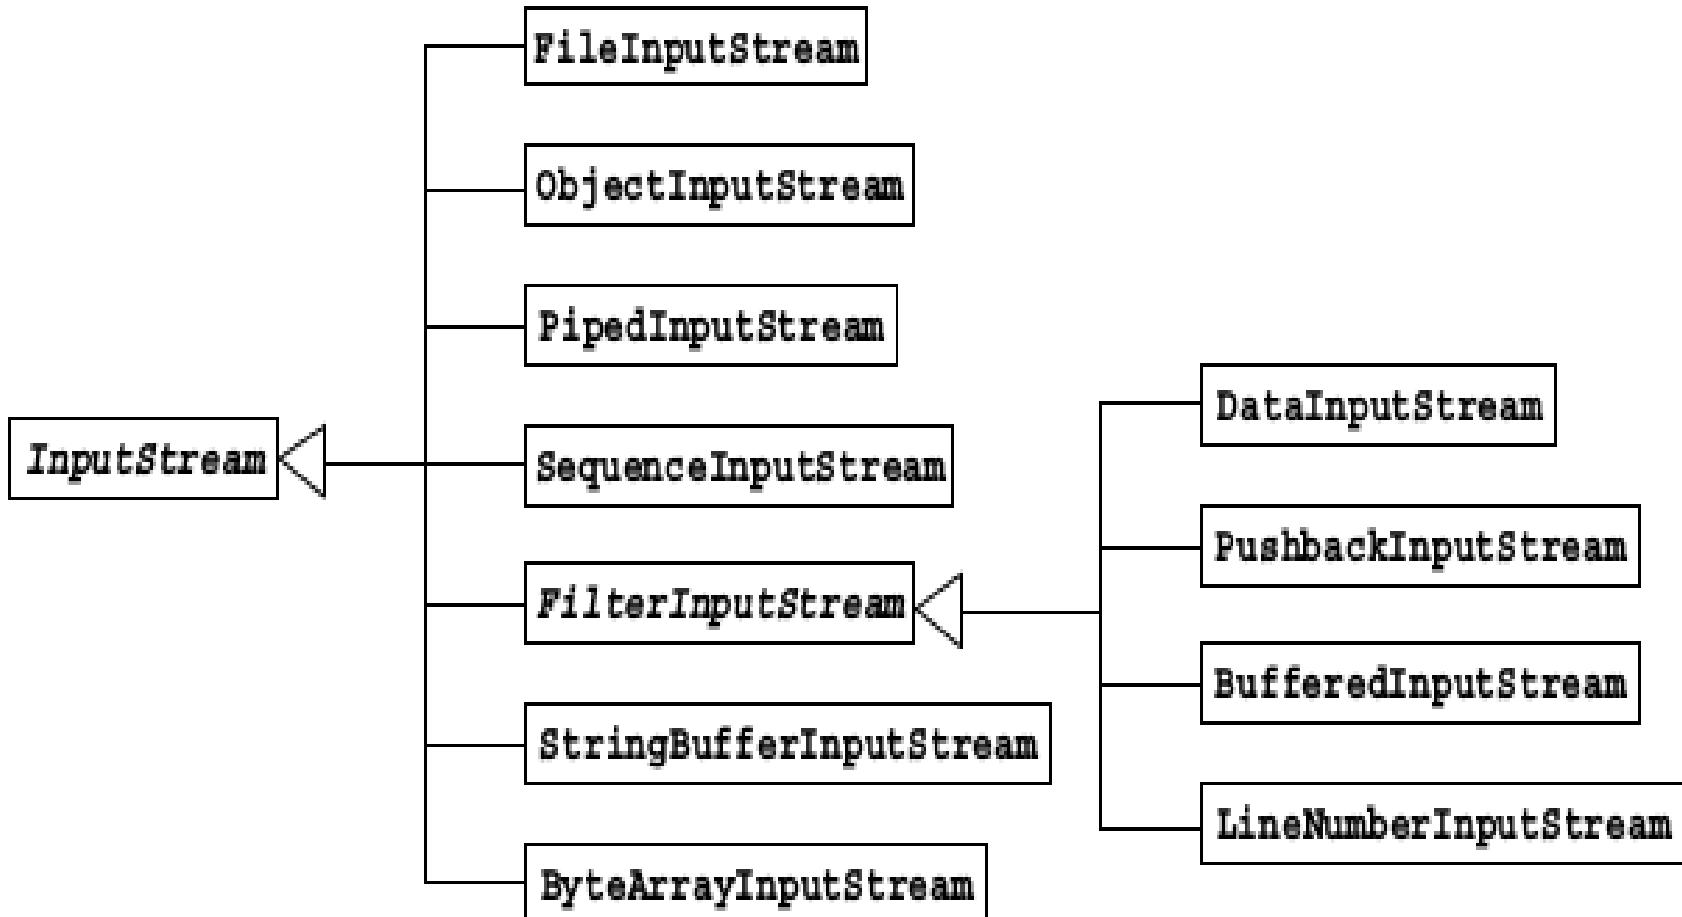

# Processing Streams

---

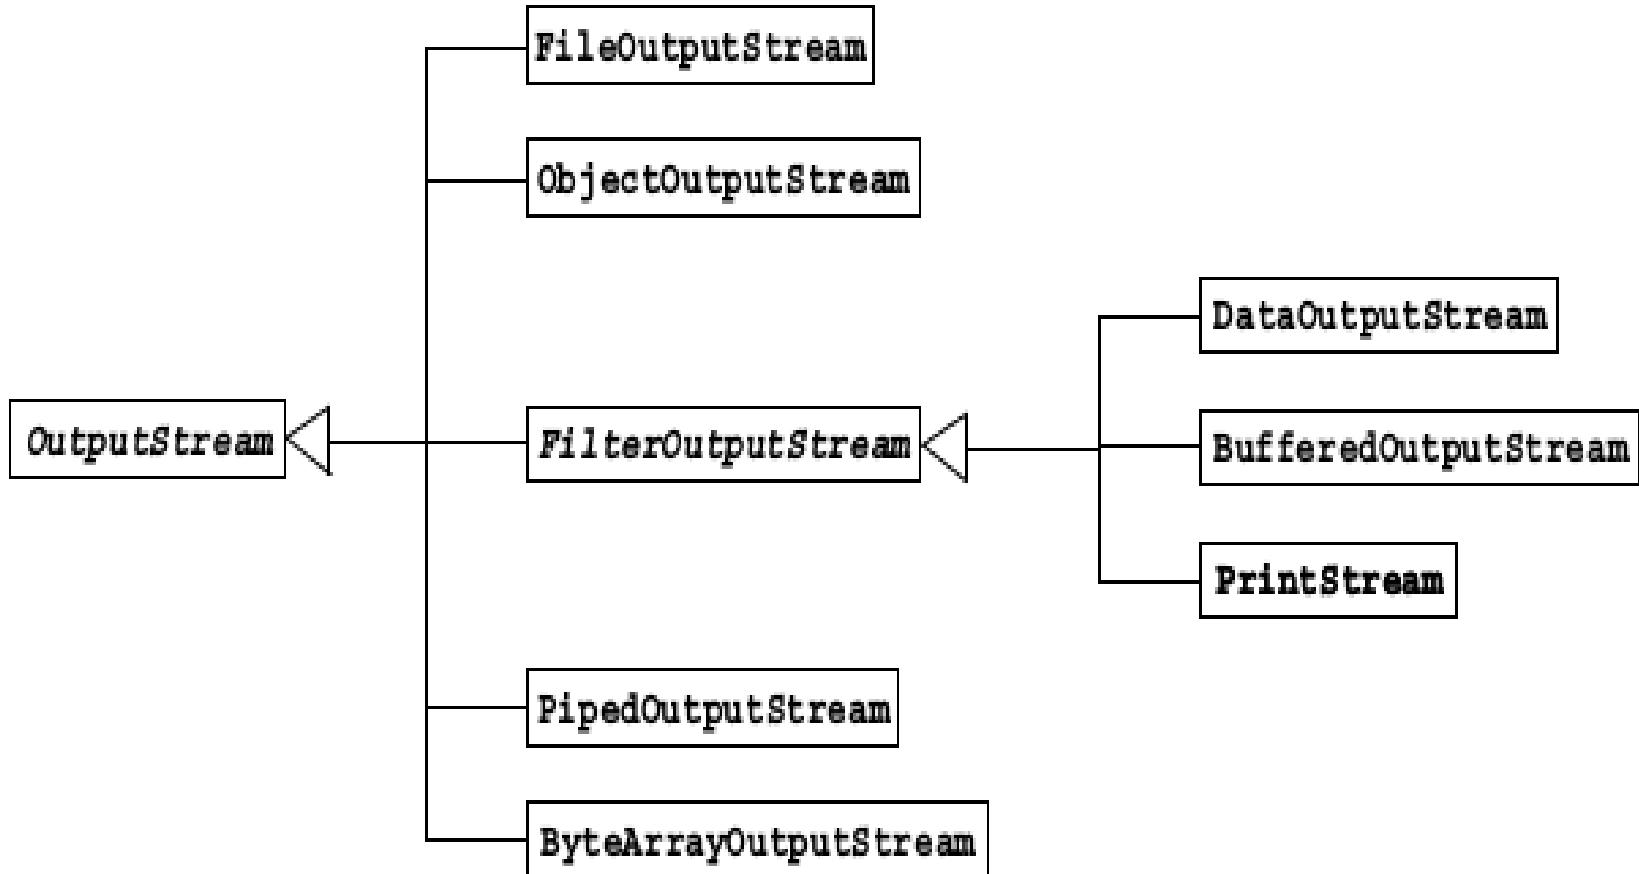

Type	Character Streams	Byte Streams
Performing data conversion		DataInputStream DataOutputStream
Counting	LineNumberReader	LineNumberInputStream
Peeking ahead	PushbackReader	PushbackInputStream
Printing	PrintWriter	PrintStream

---

# The InputStream Class Hierarchy

# The OutputStream Class Hierarchy

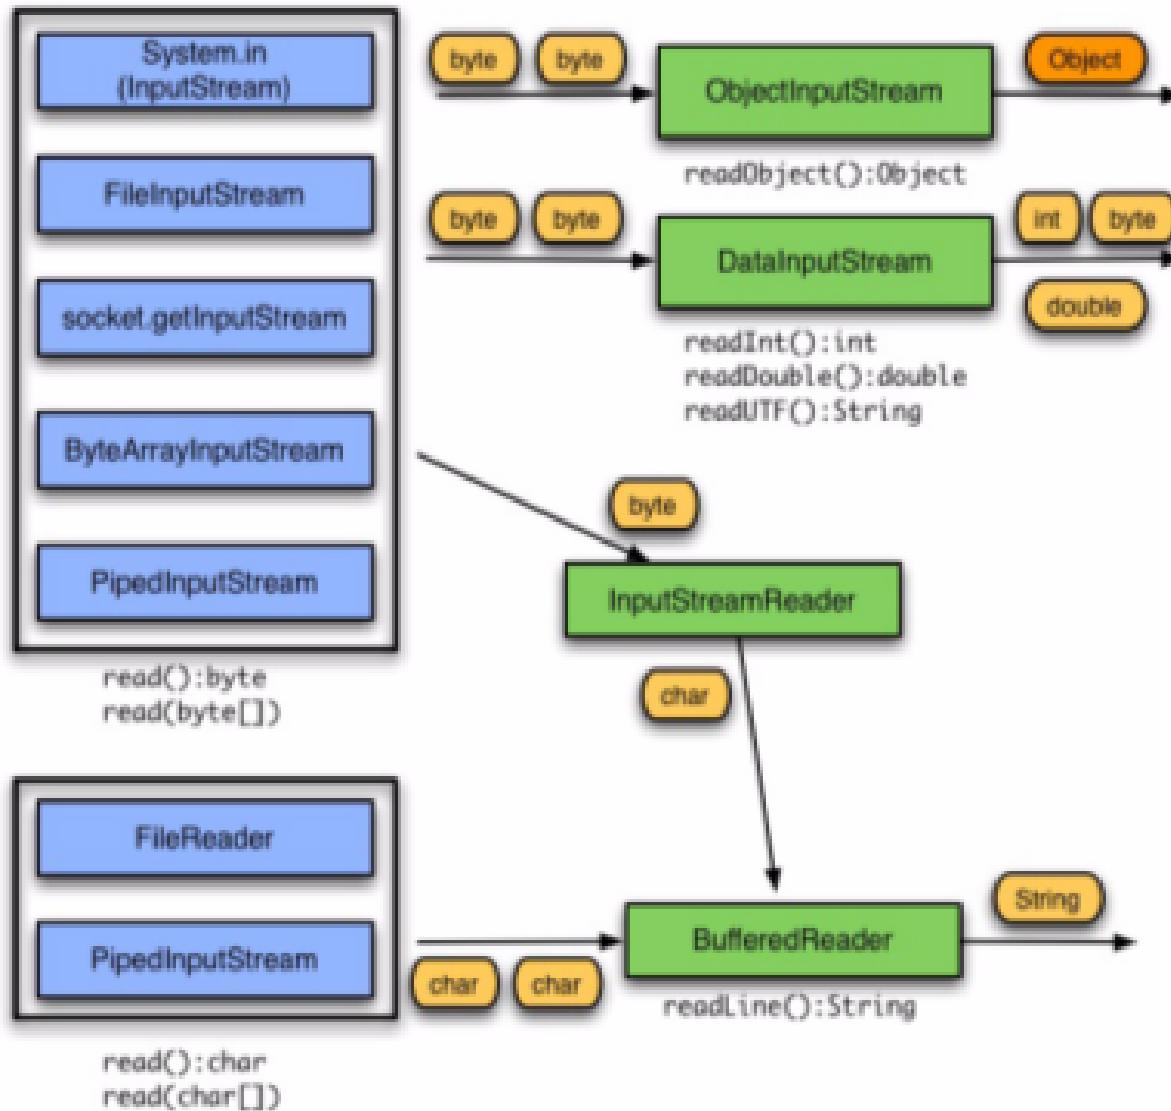

# The ObjectInputStream and The ObjectOutputStream Classes

- The Java API provides a standard mechanism (called object serialization) that completely automates the process of writing and reading objects from streams.
- When writing an object, the object input stream writes the class name, followed by a description of the data members of the class, in the order they appear in the stream, followed by the values for all the fields on that object.

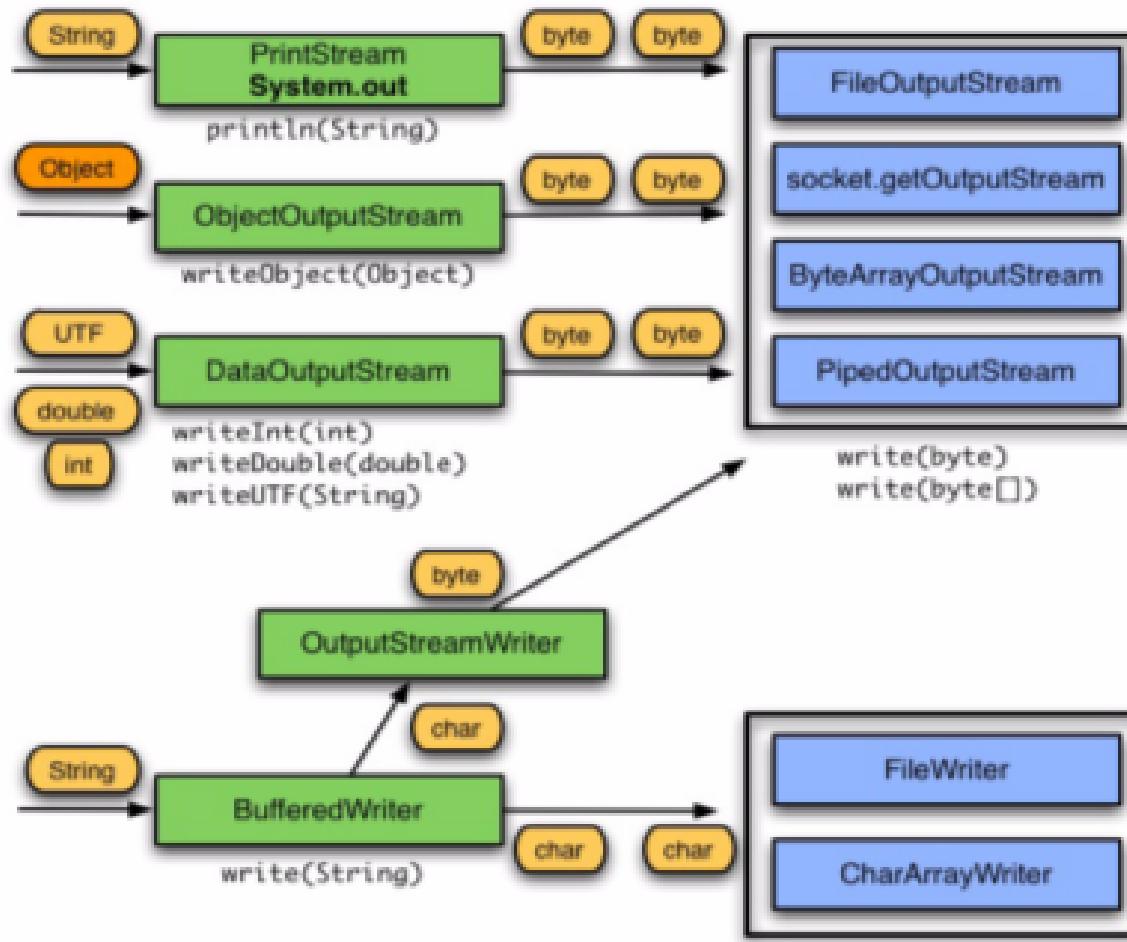

# The ObjectInputStream and The ObjectOutputStream Classes

- When reading an object, the object output stream reads the name of the class and the description of the class to match against the class in memory, and it reads the values from the stream to populate a newly allocation instance of that class.
- Persistent storage of objects can be accomplished if files (or other persistent storage) are used as streams.

# Input Chaining Combinations: A Review

# Output Chaining Combinations: A Review

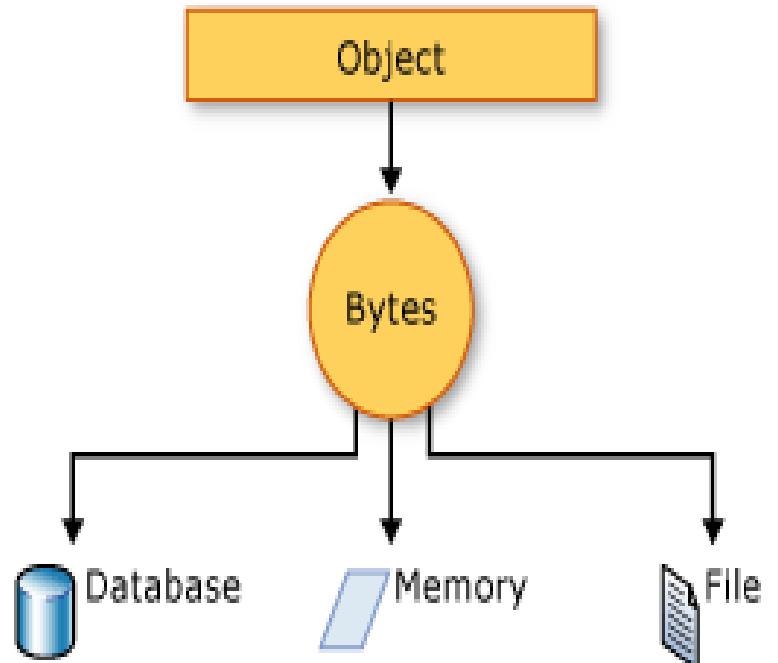

# Serialization

- Serialization is a mechanism for saving the objects as a sequence of bytes and rebuilding them later when needed.
- When an object is serialized, only the fields of the object are preserved
- When a field references an object, the fields of the referenced object are also serialized
- Some object classes are not serializable because their fields represent transient operating system-specific information.

# The SerializeDate Class

```
public class SerializeDate implements Serializable{  
    SerializeDate() {  
        Date d = new Date ();  
        try {  
            FileOutputStream f =  
                new FileOutputStream ("date.ser");  
            ObjectOutputStream s =  
                new ObjectOutputStream (f);  
            s.writeObject (d);  
            s.close ();  
        } catch (IOException e) {  
            e.printStackTrace ();  
        }  
    }  
}
```

# The SerializeDate Class

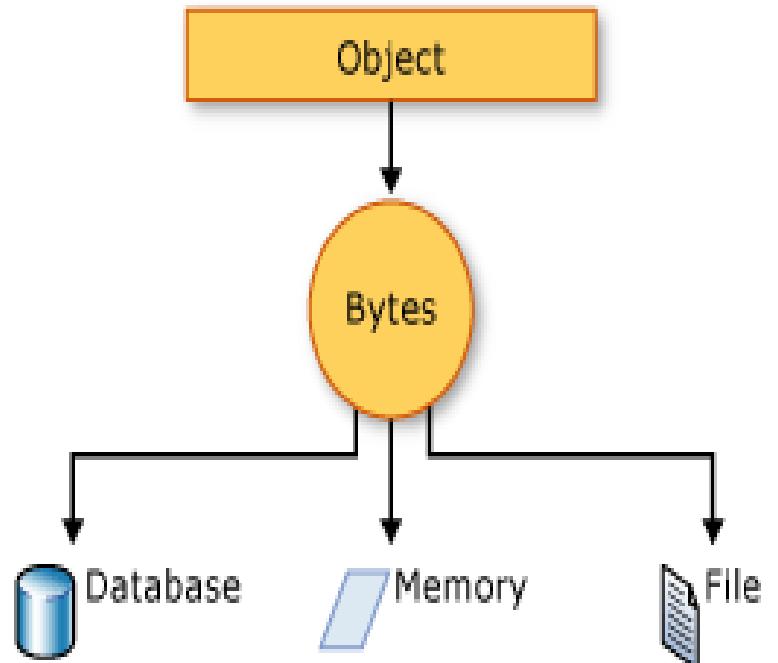

```
public static void main (String args[]) {  
    new SerializeDate();  
}
```

# The DeSerializeDate Class

```
public class DeSerializeDate {  
    DeSerializeDate () {  
        Date d = null;  
        try {  
            FileInputStream f =  
                new FileInputStream ("date.ser");  
            ObjectInputStream s =  
                new ObjectInputStream (f);  
            d = (Date) s.readObject ();  
            s.close ();  
        } catch (Exception e) {  
            e.printStackTrace ();  
        }  
    }  
}
```

# The SerializeDate Class

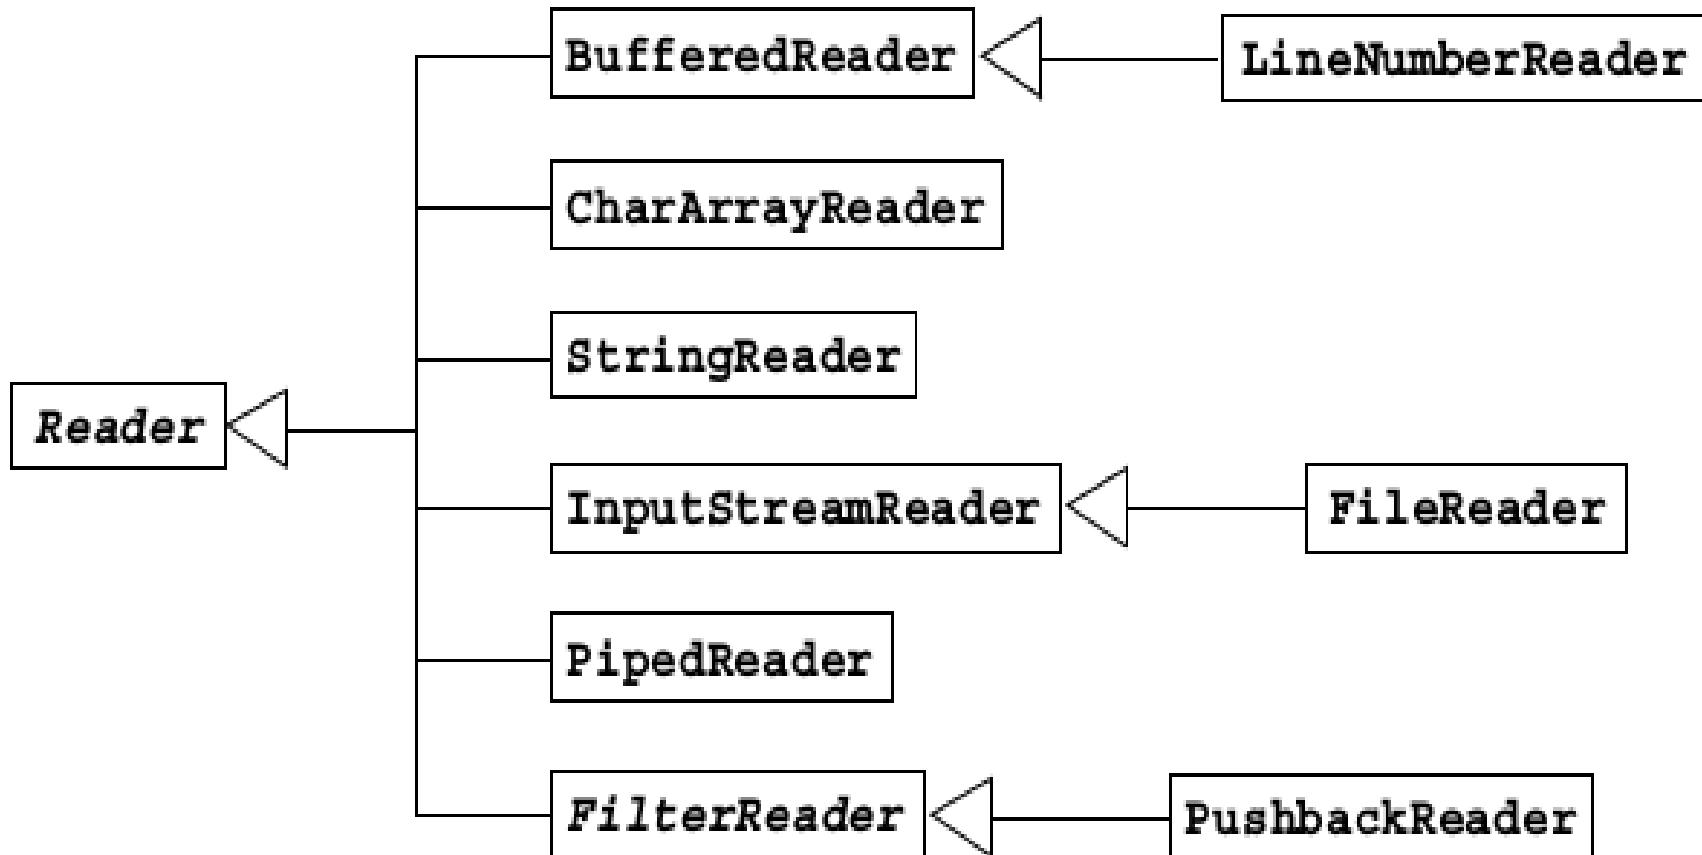

```
public class SerializeDate implements Serializable{  
    SerializeDate() {  
        Date d = new Date ();  
        try {  
            FileOutputStream f =  
                new FileOutputStream ("date.ser");  
            ObjectOutputStream s =  
                new ObjectOutputStream (f);  
            s.writeObject (d);  
            s.close ();  
        } catch (IOException e) {  
            e.printStackTrace ();  
        }  
    }  
}
```

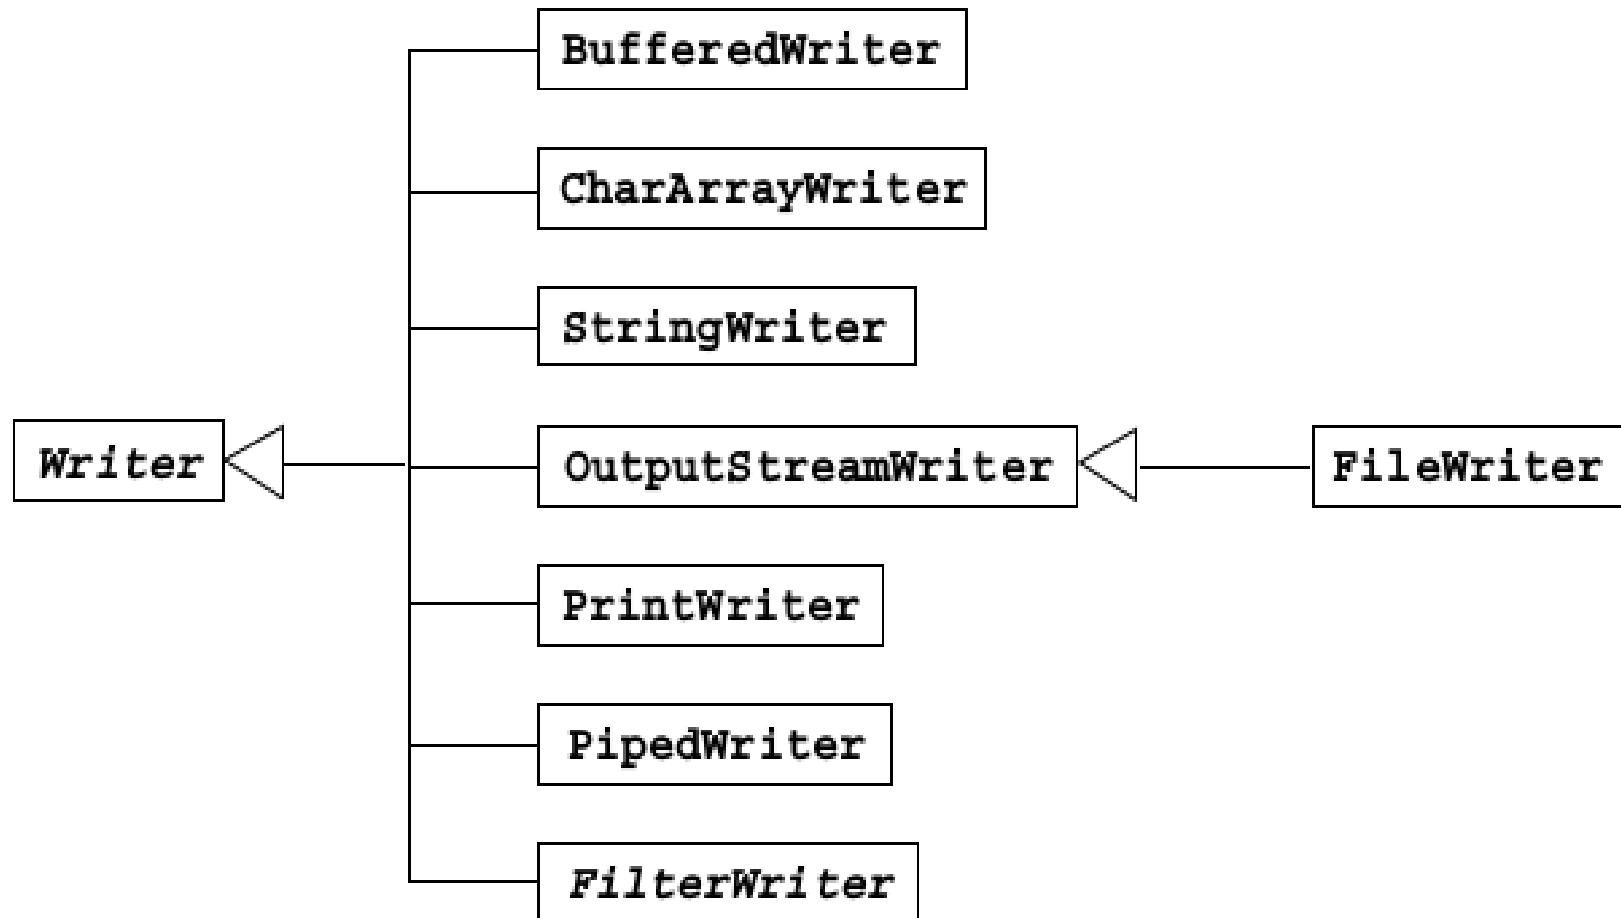

# The DeSerializeDate Class

```
System.out.println(  
    "Deserialized Date object from date.ser");  
  
System.out.println("Date: "+d);  
}  
  
public static void main (String args[]) {  
    new DeSerializeDate();  
}  
}
```
